

Mixed factoring practice and weekly check

Algebra I | CK-12: Factoring Completely

Key Idea

Always try the **GCF first**, then decide: two terms that are squares $\rightarrow$ difference of squares; three terms $\rightarrow$ product-sum trinomial.

Key Terms

- **Factor completely** — keep factoring until nothing else will

Worked steps

Step 1: Pull out any GCF.

Step 2: Match the leftover to a pattern (difference of squares or trinomial) and finish.

Example: $2x^2 - 8 = 2(x^2 - 4) = 2(x + 2)(x - 2)$.

You Try

Factor completely: $3x^2 - 27$.
