

Word bank **Anatomy:** structure — what a part IS **Physiology:** function — what a part DOES

Homeostasis: a stable internal environment **Negative feedback:** a response that REVERSES the change

VOCABULARY

Anatomy vs Physiology — anatomy is _____ (what it is); physiology is _____ (what it does)

Tissue — a group of _____ working together on one job

Organ — two or more _____ working together (e.g. the heart)

Homeostasis — keeping the body's internal conditions _____ despite outside change

CONCEPT 1 — THE SIX LEVELS OF ORGANIZATION

How does the body build from atoms up to a whole person?

1. Atoms join into molecules — the _____ level.
2. Molecules build a _____, the smallest unit of life.
3. Many similar cells form a _____; several tissues form an _____.
4. Organs that share a job form an _____; all systems together make the _____.

CONCEPT 2 — HOMEOSTASIS BY NEGATIVE FEEDBACK

You get too hot. How does your body pull you back to normal?

1. A change pushes a variable off its set point — the _____.
2. A _____ detects the change and sends the signal in.
3. The _____ (often the brain) compares it to the set point.
4. An _____ makes a response that _____ the change — bringing you back to normal.

CHECK YOUR UNDERSTANDING

1.

Put in order, smallest to largest: organ, cell, organism, tissue, organ system, chemical.

2.

Shivering when you get cold — negative or positive feedback? Explain in one sentence.

3.

Why is the heart an organ and not a tissue?

SUMMARY

Anatomy is _____, physiology is _____. The body builds _____, and _____ keeps it stable by reversing changes.
